## CHAPTER 1

### INTRODUCTION

This Validation Summary Report (VSR) describes the extent to which a specific Ada compiler conforms to the Ada Standard, ANSI/MIL-STD-1815A. This report explains all technical terms used within it and thoroughly reports the results of testing this compiler using the Ada Compiler Validation Capability (ACVC). An Ada compiler must be implemented according to the Ada Standard, and any implementation-dependent features must conform to the requirements of the Ada Standard. The Ada Standard must be implemented in its entirety, and nothing can be implemented that is not in the Standard.

Even though all validated Ada compilers conform to the Ada Standard, it must be understood that some differences do exist between implementations. The Ada Standard permits some implementation dependencies—for example, the maximum length of identifiers or the maximum values of integer types. Other differences between compilers result from the characteristics of particular operating systems, hardware, or implementation strategies. All the dependencies observed during the process of testing this compiler are given in this report.

This information in this report is derived from the test results produced during validation testing. The validation process includes submitting a suite of standardized tests, the ACVC, as inputs to an Ada compiler and evaluating the results. The purpose of validating is to ensure conformity of the compiler to the Ada Standard by testing that the compiler properly implements legal language constructs and that it identifies and rejects illegal language constructs. The testing also identifies behavior that is implementation dependent but permitted by the Ada Standard. Six classes of test are used. These tests are designed to perform checks at compile time, at link time, and during execution.

## 1.1 PURPOSE OF THIS VALIDATION SUMMARY REPORT

This VSR documents the results of the validation testing performed on an Ada compiler. Testing was carried out for the following purposes:

To attempt to identify any language constructs supported by the compiler that do not conform to the Ada Standard

To attempt to identify any unsupported language constructs required by the Ada Standard

To determine that the implementation-dependent behavior is allowed by the Ada Standard

Testing of this compiler was conducted by the National Bureau of Standards according to policies and procedures established by the Ada Validation Organization (AVO). On-site testing was completed July 8, 1988, at SoftTech Corporation, Boston, Mass.

## 1.2 USE OF THIS VALIDATION SUMMARY REPORT

Consistent with the national laws of the originating country, the AVO may make full and free public disclosure of this report. In the United States, this is provided in accordance with the "Freedom of Information Act" (5 U.S.C. #552). The results of this validation apply only to the computers, operating systems, and compiler versions identified in this report.

The organizations represented on the signature page of this report do not represent or warrant that all statements set forth in this report are accurate and complete, or that the subject compiler has no nonconformities to the Ada Standard other than those presented. Copies of this report are available to the public from:

Ada Information Clearinghouse  
Ada Joint Program Office  
OUSDRE  
The Pentagon, Rm 3D-139 (Fern Street)  
Washington DC 20301-3081

or from:

Software Standards Validation Group  
Institute for Computer Sciences and Technology  
National Bureau of Standards  
Building 225, Room A266  
Gaithersburg, Maryland 20899

Questions regarding this report or the validation test results should be directed to the AVF listed above or to:

### 1.3 REFERENCES

1. Reference Manual for the Ada Programming Language, ANSI/MIL-STD-1815A, February 1983 and ISO 8652-1987.
2. Ada Compiler Validation Procedures and Guidelines. Ada Joint Program Office, 1 January 1987.
3. Ada Compiler Validation Capability Implementers' Guide., December 1986.

### 1.4 DEFINITION OF TERMS

|                |   |
|----------------|---|
| ACVC           | The Ada Compiler Validation Capability. The set of Ada programs that tests the conformity of an Ada compiler to the Ada programming language.   |
| Ada Commentary | An Ada Commentary contains all information relevant to the point addressed by a comment on the Ada Standard. These comments are given a unique identification number having the form AI-ddddd.  |
| Ada Standard   | ANSI/MIL-STD-1815A, February 1983 and ISO 8652-1987.  |
| Applicant      | The agency requesting validation.   |
| AVF            | The Ada Validation Facility. The AVF is responsible for conducting compiler validations according to procedures contained in the <u>Ada Compiler Validation Procedures and Guidelines</u> .   |
| AVO            | The Ada Validation Organization. The AVO has oversight authority over all AVF practices for the purpose of maintaining a uniform process for validation of Ada compilers. The AVO provides administrative and technical support for Ada validations to ensure consistent practices. |

|                      |   |
|----------------------|---|
| Compiler             | A processor for the Ada language. In the context of this report, a compiler is any language processor, including cross-compilers, translators, and interpreters.  |
| Failed test          | An ACVC test for which the compiler generates a result that demonstrates nonconformity to the Ada Standard.   |
| Host                 | The computer on which the compiler resides.   |
| Inapplicable test    | An ACVC test that uses features of the language that a compiler is not required to support or may legitimately support in a way other than the one expected by the test.  |
| Language Maintenance | The Language Maintenance Panel (LMP) is a committee established by the Ada Board to recommend interpretations and Panel possible changes to the ANSI/MIL-STD for Ada.   |
| Passed test          | An ACVC test for which a compiler generates the expected result.  |
| Target               | The computer for which a compiler generates code.   |
| Test                 | An Ada program that checks a compiler's conformity regarding a particular feature or a combination of features to the Ada Standard. In the context of this report, the term is used to designate a single test, which may comprise one or more files. |
| Withdrawn test       | An ACVC test found to be incorrect and not used to check conformity to the Ada Standard. A test may be incorrect because it has an invalid test objective, fails to meet its test objective, or contains illegal or erroneous use of the language.    |

## 1.5 ACVC TEST CLASSES

Conformity to the Ada Standard is measured using the ACVC. The ACVC contains both legal and illegal Ada programs structured into six test classes: A, B, C, D, E, and L. The first letter of a test name identifies the class to which it belongs. Class A, C, D, and E tests are executable, and special program units are used to report their results during execution. Class B tests are expected to produce compilation errors. Class L tests are expected to produce compilation or link errors.

Class A tests check that legal Ada programs can be successfully compiled and executed. There are no explicit program components in a Class A

test to check semantics. For example, a Class A test checks that reserved words of another language (other than those already reserved in the Ada language) are not treated as reserved words by an Ada compiler. A Class A test is passed if no errors are detected at compile time and the program executes to produce a PASSED message.

Class B tests check that a compiler detects illegal language usage. Class B tests are not executable. Each test in this class is compiled and the resulting compilation listing is examined to verify that every syntax or semantic error in the test is detected. A Class B test is passed if every illegal construct that it contains is detected by the compiler.

Class C tests check that legal Ada programs can be correctly compiled and executed. Each Class C test is self-checking and produces a PASSED, FAILED, or NOT APPLICABLE message indicating the result when it is executed.

Class D tests check the compilation and execution capacities of a compiler. Since there are no capacity requirements placed on a compiler by the Ada Standard for some parameters—for example, the number of identifiers permitted in a compilation or the number of units in a library—a compiler may refuse to compile a Class D test and still be a conforming compiler. Therefore, if a Class D test fails to compile because the capacity of the compiler is exceeded, the test is classified as inapplicable. If a Class D test compiles successfully, it is self-checking and produces a PASSED or FAILED message during execution.

Each Class E test is self-checking and produces a NOT APPLICABLE, PASSED, or FAILED message when it is compiled and executed. However, the Ada Standard permits an implementation to reject programs containing some features addressed by Class E tests during compilation. Therefore, a Class E test is passed by a compiler if it is compiled successfully and executes to produce a PASSED message, or if it is rejected by the compiler for an allowable reason.

Class L tests check that incomplete or illegal Ada programs involving multiple, separately compiled units are detected and not allowed to execute. Class L tests are compiled separately and execution is attempted. A Class L test passes if it is rejected at link time—that is, an attempt to execute the main program must generate an error message before any declarations in the main program or any units referenced by the main program are elaborated.

Two library units, the package REPORT and the procedure CHECK FILE, support the self-checking features of the executable tests. The package REPORT provides the mechanism by which executable tests report PASSED, FAILED, or NOT APPLICABLE results. It also provides a set of identity functions used to defeat some compiler optimizations allowed by the Ada Standard that would circumvent a test objective. The procedure CHECK FILE is used to check the contents of text files written by some of the Class C tests for chapter 14 of the Ada Standard. The operation of

REPORT and CHECK\_FILE is checked by a set of executable tests. These tests produce messages that are examined to verify that the units are operating correctly. If these units are not operating correctly, then the validation is not attempted.

The text of the tests in the ACVC follow conventions that are intended to ensure that the tests are reasonably portable without modification. For example, the tests make use of only the basic set of 55 characters, contain lines with a maximum length of 72 characters, use small numeric values, and place features that may not be supported by all implementations in separate tests. However, some tests contain values that require the test to be customized according to implementation-specific values—for example, an illegal file name. A list of the values used for this validation is provided in Appendix C.

A compiler must correctly process each of the tests in the suite and demonstrate conformity to the Ada Standard by either meeting the pass criteria given for the test or by showing that the test is inapplicable to the implementation. The applicability of a test to an implementation is considered each time the implementation is validated. A test that is inapplicable for one validation is not necessarily inapplicable for a subsequent validation. Any test that was determined to contain an illegal language construct or an erroneous language construct is withdrawn from the ACVC and, therefore, is not used in testing a compiler. The tests withdrawn at the time of validation are given in Appendix D.

## CHAPTER 2

### CONFIGURATION INFORMATION

#### 2.1 CONFIGURATION TESTED

The candidate compilation system for this validation was tested under the following configuration:

Compiler: Ada 86, Version 3.21

ACVC Version: 1.9

Certificate Number: 880708S1.09151

Host Computer:

Machine: VAX 11/780 - 11/785

Operating System: VAX/VMS  
Version 4.7

Memory Size: 12 megabytes

Target Computer:

Machine: Intel iAPX 80386R

Operating System: Bare machine

Memory Size:

Communications Network: DECNET\*  
Ethernet

\*DECNET for this implementation represents the use of VAX 11/780-11/785 as host.

## 2.2 IMPLEMENTATION CHARACTERISTICS

One of the purposes of validating compilers is to determine the behavior of a compiler in those areas of the Ada Standard that permit implementations to differ. Class D and E tests specifically check for such implementation differences. However, tests in other classes also characterize an implementation. The tests demonstrate the following characteristics:

- Capacities.

The compiler correctly processes tests containing loop statements nested to 65 levels, block statements nested to 65 levels, and recursive procedures separately compiled as subunits nested to 17 levels. It correctly processes a compilation containing 723 variables in the same declarative part. (See test D55A03A..H (8 tests), D56001B, D64005E..G (3 tests), and D29002K.)

- Universal integer calculations.

An implementation is allowed to reject universal integer calculations having values that exceed `SYSTEM.MAX_INT`. This implementation 64 bit integer calculations. (See tests D4A002A, D4A002B, D4A004A, and D4A004B.)

- Predefined types.

This implementation supports the additional predefined types `LONG_INTEGER` and `LONG_FLOAT` in the package `STANDARD`. (See tests B86001BC and B86001D.)

- Based literals.

An implementation is allowed to reject a based literal with a value exceeding `SYSTEM.MAX_INT` during compilation, or it may raise `NUMERIC_ERROR` or `CONSTRAINT_ERROR` during execution. This implementation raises `NUMERIC_ERROR` during execution. (See test E24101A.)

- Expression evaluation.

Apparently all default initialization expressions or record components are evaluated before any value is checked to belong to a component's subtype. (See test C32117A.)

Assignments for subtypes are performed with less precision than the base type. (See test C35712B.)

This implementation uses no extra bits for extra precision. This implementation uses all extra bits for extra range. (See test C35903A.)

Sometimes `NUMERIC_ERROR` is raised when an integer literal operand in a comparison or membership test is outside the range of the base type. (See test C45232A.)

Apparently `NUMERIC_ERROR` is raised when a literal operand in a fixed-point comparison or membership test is outside the range of the base type. (See test C45252A.)

Apparently underflow is gradual. (See tests C45524A..Z.)

- Rounding.

The method used for rounding to integer is apparently round to even. (See tests C46012A..Z.)

The method used for rounding to longest integer is apparently round to even. (See tests C46012A..Z.)

The method used for rounding to integer in static universal real expressions is apparently round toward zero. (See test C4A014A.)

- Array types.

An implementation is allowed to raise `NUMERIC_ERROR` or `CONSTRAINT_ERROR` for an array having a `'LENGTH` that exceeds `STANDARD.INTEGER'LAST` and/or `SYSTEM.MAX_INT`. For this implementation:

Declaration of an array type or subtype declaration with more than `SYSTEM.MAX_INT` components raises `NUMERIC_ERROR`. (See test C36003A.)

`NUMERIC_ERROR` is raised when an array type with `INTEGER'LAST + 2` components is declared. (See test C36202A.)

`NUMERIC_ERROR` is raised when an array type with `SYSTEM.MAX_INT + 2` components is declared. (See test C36202B.)

A packed `BOOLEAN` array having a `'LENGTH` exceeding `INTEGER'LAST` raises no exception. (See test C52103X.)

A packed two-dimensional `BOOLEAN` array with more than

INTEGER'LAST components raises CONSTRAINT\_ERROR when the length of a dimension is calculated and exceeds INTEGER'LAST. (See test C52104Y.)

A null array with one dimension of length greater than INTEGER'LAST may raise NUMERIC\_ERROR or CONSTRAINT\_ERROR either when declared or assigned. Alternatively, an implementation may accept the declaration. However, lengths must match in array slice assignments. This implementation raises CONSTRAINT\_ERROR when array objects are assigned. (See test E52103Y.)

In assigning one-dimensional array types, the expression appears to be evaluated in its entirety before CONSTRAINT\_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. In assigning two-dimensional array types, the expression does not appear to be evaluated in its entirety before CONSTRAINT\_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

- Discriminated types.

During compilation, an implementation is allowed to either accept or reject an incomplete type with discriminants that is used in an access type definition with a compatible discriminant constraint. This implementation accepts such subtype indications during compilation. (See test E38104A.)

In assigning record types with discriminants, the expression appears to be evaluated in its entirety before CONSTRAINT\_ERROR is raised when checking whether the expression's subtype is compatible with the target's subtype. (See test C52013A.)

- Aggregates.

In the evaluation of a multi-dimensional aggregate, all choices appear to be evaluated before checking against the index type. (See tests C43207A and C43207B.)

In the evaluation of an aggregate containing subaggregates, all choices are evaluated before being checked for identical bounds. (See test E43212B.)

Not all choices are evaluated before CONSTRAINT\_ERROR is raised if a bound in a nonnull range of a nonnull aggregate does not belong to an index subtype. (See test E43211B.)

- Representation clauses.

An implementation might legitimately place restrictions on representation clauses used by some of the tests. If a representation clause is not supported, then the implementation must reject it.

Enumeration representation clauses containing noncontiguous values for enumeration types other than character and boolean types are supported. (See tests C35502I..J, C35502M..N, and A39005F.)

Enumeration representation clauses containing noncontiguous values for character types are supported. (See tests C35507I..J, C35507M..N, and C55B16A.)

Enumeration representation clauses for boolean types containing representational values other than (FALSE => 0, TRUE => 1) are supported. (See tests C35508I..J and C35508M..N.)

Length clauses with SIZE specifications for enumeration types are supported. (See test A39005B.)

Length clauses with STORAGE\_SIZE specifications for access types are supported. (See tests A39005C and C87B62B.)

Length clauses with STORAGE\_SIZE specifications for task types are supported. (See tests A39005D and C87B62D.)

Length clauses with SMALL specifications are supported. (See tests A39005E and C87B62C.)

Length clauses with SIZE specifications for derived integer types are supported. (See test C87B62A.)

- Pragma.

The pragma `INLINE` is supported for procedures. The pragma `INLINE` is supported for functions. (See tests IA3004A, IA3004B, EA3004C, EA3004D, CA3004E, and CA3004F.)

- Input/output.

The package `SEQUENTIAL_IO` cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101C, EE2201D and EE2201E.)

The package `DIRECT_IO` cannot be instantiated with unconstrained array types and record types with discriminants without defaults. (See tests AE2101H, EE2401D and EE4201G.)

The director, AJPO, has determined (AI-00332) that every call to

OPEN and CREATE must raise USE\_ERROR or NAME\_ERROR if file input/output is not supported. This implementation exhibits this behavior for SEQUENTIAL\_IO, DIRECT\_IO and TEXT\_IO.

- Generics.

Generic subprogram declarations and bodies can be compiled in separate compilations. (See tests CA1012A and CA2009F.)

Generic package declarations and bodies can be compiled in separate compilations. (See tests CA2009C, BC3204C, and BC3205D.)

Generic unit bodies and their subunits can be compiled in separate compilations. (See test CA3011A.)

## CHAPTER 3

### TEST INFORMATION

#### 3.1 TEST RESULTS

Version 1.9 of the ACVC comprises 3122 tests. When this compiler was tested, 28 tests had been withdrawn because of test errors. The AVF determined that 412 tests were inapplicable to this implementation. All inapplicable tests were processed during validation testing. Modifications to the code, processing, or grading for 25 tests were required to successfully demonstrate the test objective. (See section 3.6.)

The AVF concludes that the testing results demonstrate acceptable conformity to the Ada Standard.

#### 3.2 SUMMARY OF TEST RESULTS BY CLASS

| RESULT       | TEST CLASS |      |      |    |    |    | TOTAL |
|--------------|------------|------|------|----|----|----|-------|
|              | A          | B    | C    | D  | E  | L  |       |

### 3.4 WITHDRAWN TESTS

The following 28 tests were withdrawn from ACVC Version 1.9 at the time of this validation:

|         |         |         |         |         |         |
|---------|---------|---------|---------|---------|---------|
| B28003A | E28005C | C34004A | C35502P | A35902C | C35904A |
| C35904B | C35A03E | C35A03R | C37213H | C37213J | C37215C |
| C37215E | C37215G | C37215H | C38102C | C41402A | C45332A |
| C45614C | E66001D | A74106C | C85018B | C87B04B | CC1311B |
| BC3105A | AD1A01A | CE2401H | CE3208A |         |         |

See Appendix D for the reason that each of these tests was withdrawn.

### 3.5 INAPPLICABLE TESTS

Some tests do not apply to all compilers because they make use of features that a compiler is not required by the Ada Standard to support. Others may depend on the result of another test that is either inapplicable or withdrawn. The applicability of a test to an implementation is considered each time a validation is attempted. A test that is inapplicable for one validation attempt is not necessarily inapplicable for a subsequent attempt. For this validation attempt, 412 test were inapplicable for the reasons indicated:

C35702A uses SHORT\_FLOAT which is not supported by this implementation.

A35801E At the case statement (lines 54-63), the optimizer tries to identify which of the cases will be done during execution. The optimizer recognizes that the variable "I" which is of type integer, is

not initialized and appropriately raises a PROGRAM\_ERROR exception.  
NOTE: This test passes without the /OPTIMIZE option.

A39005G uses a record representation clause which is not supported by this compiler.

The following (14) tests use SHORT\_INTEGER, which is not supported by this compiler.

|         |         |         |         |         |
|---------|---------|---------|---------|---------|
| C45231B | C45304B | C45502B | C45503B | C45504B |
| C45504E | C45611B | C45613B | C45614B | C45631B |
| C45632B | B52004E | CS5B07B | B55B09D |         |

C45231D requires a macro substitution for any predefined numeric types other than INTEGER, SHORT\_INTEGER, LONG\_INTEGER, FLOAT, SHORT\_FLOAT, and LONG\_FLOAT. This compiler does not support any such types.

C45304A, C45304C and C46014A expect exceptions to be raised as the result of performing "dead assignments" (assignments to a variable whose value is never used in the program).

C45531M, C45531N, C45532M, and C45532N use fine 48-bit fixed-point base types which are not supported by this compiler.

C45531O, C45531P, C45532O, and C45532P use coarse 48-bit fixed-point base types which are not supported by this compiler.

B86001D requires a predefined numeric type other than those defined by the Ada language in package STANDARD. There is no such type for this implementation.

C86001F redefines package SYSTEM, but TEXT\_IO is made obsolete by this new definition in this implementation and the test cannot be executed since the package REPORT is dependent on the package TEXT\_IO.

AE2101C, EE2201D, and EE2201E use instantiations of package SEQUENTIAL\_IO with unconstrained array types and record types having discriminants without defaults. These instantiations are rejected by this compiler.

AE2101H, EE2401D, and EE2401G use instantiations of package DIRECT\_IO with unconstrained array types and record types having discriminants without defaults. These instantiations are rejected by this compiler.

The following 174 tests are inapplicable because sequential, text, and direct access files are not supported.

|               |               |               |               |
|---------------|---------------|---------------|---------------|
| CE2102C       | CE2102G..H(2) | CE2102K       | CE2104A..D(4) |
| CE2105A..B(2) | CE2106A..B(2) | CE2107A..I(9) | CE2108A..D(4) |
| CE2109A..C(3) | CE2110A..C(3) | CE2111A..E(5) | CE2111G..H(2) |
| CE2115A..B(2) | CE2201A..C(3) | CE2201F..G(2) | CE2204A..B(2) |
| CE2208E       | CE2210A       | CE2401A..C(3) | CE2401E..F(2) |

|               |               |               |               |
|---------------|---------------|---------------|---------------|
| CE2404A       | CE2405B       | CE2406A       | CE2407A       |
| CE2408A       | CE2409A       | CE2410A       | CE2411A       |
| AE3101A       | CE3102B       | EE3102C       | CE3103A       |
| CE3104A       | CE3107A       | CE3108A..B(2) | CE3109A       |
| CE3110A       | CE3111A..E(5) | CE3112A..B(2) | CE3114A..B(2) |
| CE3115A       | CE3203A       | CE3301A..C(3) | CE3302A       |
| CE3305A       | CE3402A..D(4) | CE3403A..C(3) | CE3403E..F(2) |
| CE3404A..C(3) | CE3405A..D(4) | CE3406A..D(4) | CE3407A..C(3) |
| CE3408A..C(3) | CE3409A       | CE3409C..F(4) | CE3410A       |
| CE3410C..F(4) | CE3411A       | CE3412A       | CE3413A       |
| CE3413C       | CE3602A..D(4) | CE3603A       | CE3604A       |
| CE3605A..E(5) | CE3606A..B(2) | CE3704A..B(2) | CE3704D..F(3) |
| CE3704M..O(3) | CE3706D       | CE3706F       | CE3804A..E(5) |
| CE3804G       | CE3804I       | CE3804K       | CE3804M       |
| CE3805A..B(2) | CE3806A       | CE3806D..E(2) | CE3905A..C(3) |
| CE3905L       | CE3906A..C(3) | CE3906E..F(2) |               |

The following 201 tests require a floating-point accuracy that exceeds the maximum of 15 digits supported by this implementation:

|                       |                       |
|-----------------------|-----------------------|
| C24113L..Y (14 tests) | C35705L..Y (14 tests) |
| C35706L..Y (14 tests) | C35707L..Y (14 tests) |
| C35708L..Y (14 tests) | C35802L..Z (15 tests) |
| C45241L..Y (14 tests) | C45321L..Y (14 tests) |
| C45421L..Y (14 tests) | C45521L..Z (15 tests) |
| C45524L..Z (15 tests) | C45621L..Z (15 tests) |
| C45641L..Y (14 tests) | C46012L..Z (15 tests) |

### 3.6 TEST, PROCESSING, AND EVALUATION MODIFICATIONS

It is expected that some tests will require modifications of code, processing, or evaluation in order to compensate for legitimate implementation behavior. Modifications are made by the AVF in cases where legitimate implementation behavior prevents the successful completion of an (otherwise) applicable test. Examples of such modifications include: adding a length clause to alter the default size of a collection; splitting a Class B test into sub-tests so that all errors are detected; and confirming that messages produced by an executable test demonstrate conforming behavior that wasn't anticipated by the test (such as raising one exception instead of another).

Modifications were required for 24 Class B tests.

The following Class B tests were split because syntax errors at one point resulted in the compiler not detecting other errors in the test:

|                      |            |            |         |
|----------------------|------------|------------|---------|
| B2A003A..C (3 tests) | B33201C    | B33202C    | B33203C |
| B33301C              | B37106A    | B37201A    | B37301I |
| B38001C              | B38003A..B | B38009A..B | B44001A |
| B54A01C              | B54A01L    | B95063A    | BC1008A |
| BC3013A              |            |            | BC1201L |

C4A012B requires that a CONSTRAINT\_ERROR be raised in a context where a NUMERIC\_ERROR is relevant on line 35, etc. The test has been evaluated and recommended to be graded as passed.

### 3.7 ADDITIONAL TESTING INFORMATION

#### 3.7.1 Prevalidation

Prior to validation, a set of test results for ACVC Version 1.9 produced by the Ada 86 was submitted to the AVF by the applicant for review. Analysis of these results demonstrated that the compiler successfully passed all applicable tests, and the compiler exhibited the expected behavior on all inapplicable tests.

#### 3.7.2 Test Method

Testing of the Ada 86 using ACVC Version 1.9 was conducted on-site by a validation team from the AVF. The configuration consisted of a VAX 11/780 - 11/785 host operating under VAX/VMS, Version 4.7, and an iAPX 80386R target operating under bare machine. The host and target computers were linked via DECNET.

A magnetic tape containing all tests was taken on-site by the validation team for processing. Tests that make use of implementation-specific values were customized on-site after the magnetic tape was loaded. Tests requiring modifications during the prevalidation testing were not included in their modified form on the magnetic tape. The contents of the magnetic tape were loaded directly onto the host computer.

After the test files were loaded to disk, the full set of tests was compiled and linked on the VAX 11/780 - 11/785, and all executable tests were run on the iAPX 80386R. Object files were linked on the host computer, and executable images were transferred to the target computer via DECNET. Results were printed from the host computer, with results being transferred to the host computer via DECNET.

The compiler was tested using command scripts provided by SofTech, Incorporated and reviewed by the validation team. The compiler was tested using all default option settings without exception.

Tests were compiled, linked, and executed (as appropriate) using a single host computer and a single target computer. Test output, compilation listings, and job logs were captured on magnetic tape and archived at the AVF. The listings examined on-site by the validation team were also archived.

### 3.7.3 Test Site

Testing was conducted at SofTech, Incorporated, Boston, Massachusetts and was completed on July 8, 1988.

DECLARATION OF CONFORMANCE

## APPENDIX A

### DECLARATION OF CONFORMANCE

Compiler Implementer: SofTech Inc.  
460 Totten Pond Road  
Waltham, MA 02254

Ada Validation Facility: National Bureau of Standards (NBS)  
Institute for Computer Sciences and Technology (ICST)  
Software Standards Validation Group

## Implementer's Declaration

I, the undersigned, representing SofTech, Inc., have implemented no deliberate extensions to the Ada Language Standard ANSI/MIL-STD-1815A in the compiler(s) listed in this declaration. I declare that the SofTech Inc. is the owner on record of the Ada language compiler(s) listed above and, as such, is responsible for maintaining said compiler(s) in conformance to ANSI-MIL-STD-1815A. All certificates and registrations for Ada language compiler(s) listed in this declaration shall be made only in the owner's corporate name.

Charles E. Collins, General Manager  
Implementer's Signature and Title

Date

## Implementer's Declaration

## Owner's Declaration

I, the undersigned, representing SofTech Inc., take full responsibility for implementation and maintenance of the Ada compiler(s) listed above, and agree to the public disclosure of the final Validation Summary Report. I further agree to continue to comply with the Ada trademark policy, as defined by the Ada Joint Program Office. I declare that all of the Ada language compilers listed, and their host/target performance are in compliance with the Ada Language Standard ANSI/MIL-STD-1815A. I have reviewed the Validation Summary Report for the compilers(s) and concur with the contents.

James Thorne, Jr., President

## APPENDIX B

### - APPENDIX F OF THE Ada STANDARD

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine-dependent conventions as mentioned in chapter 13 of the Ada Standard, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics of the Ada 86, Version 3.21, are described in the following sections which discuss topics in Appendix F of the Ada Standard. Implementation-specific portions of the package STANDARD are also included in this appendix.

package STANDARD is

type INTEGER is range -32\_768 .. 32\_767;

type LONG\_INTEGER is range -2\_147\_483\_648 .. 2\_147\_483\_647;

type FLOAT is digits 6 range -(2#1.111\_(5)1111#E+127) ..  
(2#1.111\_(5)1111#E+127);

type LONG\_FLOAT is digits 15 range  
-(2#1.111\_(12)1111\_1#E+1023 ..  
(2#1.111\_(12)1111\_1#E+1023;

type DURATION is delta 2.0\*\*(-14) range -131\_072.0 ..  
131\_072.0;

end STANDARD;

## APPENDIX F

## APPENDIX F OF THE Ada STANDARD for SofTech's Ada86 toolset

The only allowed implementation dependencies correspond to implementation-dependent pragmas, to certain machine\_dependent conventions as mentioned in chapter 13 of MIL-STD-1815A, and to certain allowed restrictions on representation clauses. The implementation-dependent characteristics are described in the following sections which discuss topics one through eight as stated in Appendix F of the Ada Language Reference Manual (ANSI/MIL-STD-1815A). Two other sections, package STANDARD and file naming conventions, are also included in this appendix.

## (1) Implementation-Dependent Pragmas

This section may be copied from the applicant's documentation, but make sure it covers all the items below.

The pragmas described below are implementation-defined.

```
Pragma TITLE (arg);
```

This is a listing control pragma. "Arg" is a CHARACTER string literal that is to appear on the second line of each page of every listing produced for a compilation unit in the compilation. At most, one such pragma may appear for any compilation, and it must be the first unit in the compilation (comments and other pragmas excepted).

For many real time applications, fast software reaction to hardware interrupts is important. A group of pragmas is provided in recognition of this requirement.

If an Ada task entry has been equated to a hardware interrupt through an address clause (c.f. LRM 13.5.1), the occurrence of the hardware interrupt in question is interpreted by the RSL as an entry call to the corresponding task entry. The object code generated to implement interrupt entries includes some overhead, since the Ada programmer is allowed to make use of the full Ada language within the accept body for the interrupt entry.

~~~~~  
(3) Package SYSTEM  
~~~~~

package SYSTEM is --[LRM 13.7 and F]

type WORD is range 0..16#FFFF#;  
for WORD'SIZE use 16; --see[ LRM 3.4(10) ]  
-- Ada SIZE attribute gives 16, but machine size is 32.

type BYTE is range 0..255;  
for BYTE'SIZE use 8;  
-- Ada SIZE attribute gives 8, but machine size is 16.

subtype REGISTER is SYSTEM.WORD;

--#START iAPX86, iAPX186, iAPX286R, iAPX386R, PC\_DOS  
subtype SEGMENT\_REGISTER is SYSTEM.REGISTER;

NULL\_SEGMENT: constant SYSTEM.SEGMENT\_REGISTER := 0;  
--#STOP iAPX86, iAPX186, iAPX286R, iAPX386R, PC\_DOS

--#START iAPX286P, iAPX386P

--# type SEGMENT\_LENGTH\_IN\_BYTES is range 1..65536;  
--# -- Gives the range the length an iAPX286 memory segment can be.  
--# -- The hardware deals with segment limits which is the length  
--# -- of the segment relative to the base minus one.  
--# -- It is more convenient to use the length of the segment  
--# -- so this type is provided.  
--# -- See page 7-13 of the Intel iAPX286 Programmer's Reference Manual.

--# type PRIVILEGE\_LEVEL is range 0..3;  
--# for PRIVILEGE\_LEVEL'SIZE use 2;  
--# -- Privilege level as defined by the iAPX286 hardware.

--# -- The following types form an iAPX286 selector as described on page 7-11  
--# -- of the Intel iAPX286 Programmer's Reference Manual.

--# type DESCRIPTOR\_TABLE\_INDEX is range 0..8191;  
--# for DESCRIPTOR\_TABLE\_INDEX'SIZE use 13;  
--# -- Index into the global or local descriptor table.

~~--# type DESCRIPTOR\_TABLE\_INDICATOR is~~  
~~--# (USE\_GLOBAL\_DESCRIPTOR\_TABLE, USE\_LOCAL\_DESCRIPTOR\_TABLE);~~

--# for DESCRIPTOR\_TABLE\_INDICATOR use  
--# (USE\_GLOBAL\_DESCRIPTOR\_TABLE => 0, USE\_LOCAL\_DESCRIPTOR\_TABLE => 1);

--# for DESCRIPTOR\_TABLE\_INDICATOR'SIZE use 1;  
--# -- Indicates whether to use the global or the local descriptor table.

--# type SEGMENT\_REGISTER is  
--# record  
--# -- This is a segment selector as defined by the iAPX286 hardware.

```

--#      -- See page 7-11 of the Intel iAPX286 Programmer's Reference Manual.

--#      DESCRIPTOR_INDEX: DESCRIPTOR_TABLE_INDEX;
--#      -- This is an index into either the global or the local
--#      -- descriptor table. The index will select one of the 8 byte
--#      -- descriptors in the table.
--#      -- The table to use is given by the TABLE_INDICATOR field.
--#      -- NOTE:
--#      -- Even if an index is in the proper range, it might not refer
--#      -- to an existing or valid descriptor. See page 7-5 of the
--#      -- Intel iAPX286 Programmer's Reference Manual.

--#      TABLE_INDICATOR: DESCRIPTOR_TABLE_INDICATOR;
--#      -- Whether the index is an index into the global or the local
--#      -- descriptor table;

--#      REQUESTED_PRIVILEGE_LEVEL: PRIVILEGE_LEVEL;
--#      -- The requested privilege level reflects the privilege level of
--#      -- original supplier of the selector. Needed when addresses are
--#      -- passed through intermediate levels. See page 7-14 of the
--#      -- Intel iAPX286 Programmer's Reference Manual.

pragma PAGE;

--The enumeration literals of type ENTRY\_KIND distinguish between entries of  
--software tasks and interrupt entries, and identify different varieties of  
--the latter when used as the second argument in a FAST\_INTERRUPT\_ENTRY  
--pragma:

type ENTRY\_KIND is

(

-----  
--ORDINARY\_INTERRUPT\_ENTRY--  
-----

ORDINARY\_INTERRUPT\_ENTRY,

--This is not a Fast Interrupt Entry. It is invoked by an interrupt  
--other than NMI. This entry may be called by a software task as  
--well as by interrupt.

-----  
--If an interrupt is equated to an entry by means of an address  
--clause, and the FAST\_INTERRUPT\_ENTRY pragma is not given for that  
--entry, the entry will be treated as an ORDINARY\_INTERRUPT\_ENTRY by  
--default.

--When this kind of interrupt entry occurs, the state of the 8087  
--Numeric Data Processor will always be saved as part of the context  
--of the interrupted task, because the normal task-switching  
--mechanism will attempt to restore it before resuming the  
--interrupted task.

```
--This is a Non-Maskable Interrupt Entry invoked only by NMI whose
--accept body makes no entry calls.
```

#### NO\_NDP\_NON\_MASKABLE

```
--This is a Non-Maskable Interrupt Entry invoked only by NMI whose
--accept body makes no entry calls.
```

```
--It differs from NON_MASKABLE only in that the state of the 8087
--Numeric Data Processor is neither saved nor restored during
--interrupt delivery.
```

```
);
```

```
pragma PAGE;
```

```
-----
-- NOTE: Be sure to compute TICK and TICKS_PER_DAY by hand, as the roundoff --
-- errors introduced in computer arithmetic are unacceptably inaccurate. --
-----
```

#### --#START iAPX86

```
--If one loaded the Programmable Interval Timer (PIT) clock counter with t
he
--shortest possible delay, namely 1, TICK is the amount of time, in second
s,
--which would pass between the loading and the interrupt which the PIT wou
ld
--issue upon counting down and reaching zero.
```

```
TICK : constant := 6.510_416_666_666_666_666_667E-6;
```

```
--roughly 6.5 microseconds
```

#### --#STOP iAPX86

#### --#START iAPX186

```
--# --For the system clock counter of the iAPX186's Internal Timer Unit, TICK
is
--# --the amount of time, in seconds, that it takes to count from 0 to 1.

--# --IMPORTANT: The iSBC 186/03A runs at 8 MHz, and its Internal Timer Unit's
--# --base clock rate is 8 MHz divided by four, or 2 MHz.
--# --Therefore one counter tick = 1 sec. / 2_000_000 = 0.000_000_5 sec.
--# --One major clock cycle = 2**16 * one counter tick
--# -- = 65_536 * 0.000_000_5 sec.
--# -- = 0.032_768 sec.
--# --We would like a greater time interval between counter interrupts used fo
r
--# --timekeeping. In fact, we would like about one second, or as close as
--# --possible. This means that we must prescale our system clock counter.
```

```
--# --To find prescale factor, solve for X:
--# -- X * one major clock cycle = 1 second
--# -- X * 0.032_768 sec. = 1 sec.
--# -- X = 1 / 0.032_768
--# -- X = 30.517_578_125
--# -- X = 30
```

```
--# --So SYSTEM.TICK = a prescaled counter tick
--# -- = 30 * 0.000_000_5 sec.
--# -- = 0.000_015 sec.
```

```

--# --and a prescaled major clock cycle = 2**16 * one prescaled counter tick
--# --                                     = 65_536 * 0.000_015 sec.
--# --                                     = 0.983 sec.
--# --
--# --There are 66_666 + 2/3 ticks in a second.
--# --The number of ticks per second must be used to calculate the values of t
he
--# --ADA_RSL constants CLOCK_TICKS_PER_DAY, TICKS_PER_HALF_DAY, and INT_CHUNK_
--# --RAW_TIME.

```

\*\*\*\*\*  
 (4) Representation Clause Restrictions  
 \*\*\*\*\*

Representation clauses specify how the types of the language are to be mapped onto the underlying machine. The following are restrictions on representation clauses.

## Address Clauses

Address clauses are supported for the following items:

1. Scalar or composite objects with the following restrictions:
  - (a) The object must not be nested within a subprogram or task directly or indirectly.
  - (b) The size of the object must be determinable at time of compilation.
2. Subprograms with the following restrictions:
  - (a) The subprogram can not be a library subprogram (LRM requirement).
  - (b) Any subprogram declared within a subprogram having an address clause will be placed in relocatable sections.
3. Entries - An address clause may specify a hardware interrupt with which the entry is to be associated.

### Length Clause

T'STORAGE\_SIZE for task type T specifies the number of bytes to be allocated for the run-time stack of each task object of type T.

### Enumeration Representation Clause

In the absence of a representation specification for an enumeration type T, the internal representation of T'FIRST is 0. The default SIZE for a stand-alone object of enumeration type T will be the smallest of the values 8, 16, or 32, such that the internal representation of T'FIRST and T'LAST both fall within the range: ~~enum T {~~

```
-2**(T'SIZE - 1) .. 2**(T'SIZE - 1)-1.
```

Length specifications of the form:

for T'SIZE use N;

and/or enumeration representations of the form:

for T use aggregate

Are permitted for N in 2..32, provided the representations and the SIZE conform to the relationship specified above, or else for N in 1..31, provided that the internal representation of T'FIRST  $\geq 0$  and the representation of T'LAST  $= 2^{**}(T'SIZE) - 1$ .

For components of enumeration types within packed composite objects, the smaller of the default stand-alone SIZE and the SIZE from a length specification is used.

In accordance with the rules of Ada, and the implementation of package STANDARD, enumeration representation on types derived from the predefined type BOOLEAN are not accepted, but length specifications are accepted.

#### Record Representation Clause

A length specification of the form

for T'SIZE use N;

Will cause arrays and records to be packed, if required, to accommodate the length specification.

The PACK pragma may be used to minimize wasted space between components of arrays and records. The pragma causes the type representation to be chosen such that storage space requirements are minimized at the possible expense of data access time and and code space.

A record type representation specification may be used to describe the allocation of components in a record. Bits are numbered 0..7 from the right. (Bit 8 starts at the right of the next higher-numbered byte.)

The alignment clause of the form:

at mod N

can specify alignment of 1 (byte) or 2 (word).

~~~~~  
(5) Conventions  
~~~~~

+++++

The following conventions are used for an implementation-generated name denoting implementation-dependent components.

+++++

**NONE**

(6) Address Clauses

+++++

The following are conventions that define the interpretation of expressions that appear in address clauses, including those for interrupts.

+++++

**NONE**

\*\*\*\*\*  
(7) Unchecked Conversions \*\*\*\*\*

+++++

The following are restrictions on unchecked conversion,  
including those depending on the respective sizes of objects  
of the source and target.

+++++

A program is erroneous if it performs UNCHECKED-CONVERSION when the size of the source and target types have different.

```

(8)  Input-Output Packages

```

+++++

The following are implementation-dependent characteristics  
of the input-output packages.

+++++

## SEQUENTIAL IO Package

**NOT SUPPORTED**

```

+++++
Declare file type and applicable operations for files of
this type.
+++++

```

## DIRECT IO Package

**NOT SUPPORTED**

## TEXT\_IO Package

### --\* PACKAGE SPECIFICATION FOR TEXT\_IO

\*\*\*\*\*

The Specification of the Package TEXT\_IO contains the following  
(implementation specific) definitions in addition to those specified  
in 14.3.10 of the LRM:

\*\*\*\*\*

--# Copyright 1986 Softech, Inc., all rights reserved.

-- Copyright (C) 1987, SofTech, Inc.

with ADA\_RSL, IO\_EXCEPTIONS;

--#START IAPX86, IAPX186, IAPX286R, IAPX386R, IAPX286P, IAPX386P  
with SYSTEM, IO\_DEFS;

--#STOP IAPX86, IAPX186, IAPX286R, IAPX386R, IAPX286P, IAPX386P

--#START PC\_DOS

--# with SYSTEM, IO\_DEFS, BASIC\_IO;

--#STOP PC\_DOS

### --\* PACKAGE SPECIFICATION FOR TEXT\_IO

#### --\* PURPOSE:

--# This package provides input and output services for textual files

--#

--# including creation, deletion, opening, and closing of said files.

--# This package is as specified in the Ada Reference Manual (1982).

--#

--# And here a word about primary and secondary routines. A primary routine  
is

--# always visible outside the package. If it references a file, it will  
--# attempt to gain exclusive access to that file descriptor. (The term

--# "exclusive access" is used with regard to tasks.) All modifications or  
--# tests on file descriptor FIELDS must be made only if the current task

--# has exclusive access to that descriptor. In every case where a primary  
--# routine gains exclusive access to a file descriptor, that routine must

--# release the file descriptor BEFORE exiting. Primary routines may call  
--# primary or secondary routines. Secondary routines are never visible

--# outside the package. If a secondary routine references a file descriptor

--# that routine assumes exclusive access for that descriptor. Secondary

--# routines may only call other secondary routines. All calls to BASIC\_IO

--# for reading or writing are made by secondary routines. All other

--# BASIC\_IO calls are made by primary routines.

PRIVATE

-- REPRESENTATION OF TEXT\_IO FILES:

-- This implementation of TEXT\_IO is for the Intel targets. For  
-- input files, a variety of possible file formats are supported.  
-- For output, a single canonical format corresponding to the format  
-- of DOS produced text files is used.

TEXT\_IO OUTPUT FILE FORMAT

file ::= page {eop page} eof

page ::= line {eol line}

line ::= {character}

eol ::= ASCII.CR ASCII.LF

eop ::= ASCII.FF

eof ::= ASCII.SUB

character ::= any ASCII character except CR, LF, FF, and SUB

Note that for an output file, a physical line terminator ends every line except the last line in each page. A physical page terminator follows every page except the last page which is terminated by the physical file terminator. The final page terminator is omitted in keeping with common practice.

An empty physical file logically consists of an Ada line terminator followed by a page terminator, followed by a file terminator. A physical file containing only a form feed character logically consists of two pages, each containing a single line empty line.

TEXT\_IO INPUT FILE FORMATS

The PHYSICAL syntax for an INPUT file is broad enough to accept a variety of possible text file forms including some which are not produced by TEXT\_IO. The following physical text patterns are interpreted as Ada logical lines, pages and files by TEXT\_IO when reading files:

file ::= page {eop page} eof

page ::= line {eol line}

line ::= {character}

eol ::= ASCII.CR ASCII.LF

```

--          | ASCII.CR
--          | ASCII.LF
--
--      eop      ::=  ASCII.FF
--
--      eof      ::=  ASCII.SUB
--                  | (end of data condition)
--
--      character ::= any character except ASCII: CR, LF, FF, SUB.
--
--
--      Thus for an input file, a line may be explicitly terminated by a carriage
--      return/line feed pair, by carriage return alone, or by line feed alone.
--      An end of line is always implicit in a form feed or the physical end of
--      file.
--
--      A file may be explicitly terminated by a control Z character or
--      implicitly when the end of input data is encountered. However, an
--      embedded control Z character will be treated as the end of file even
--      though it may not be the physical end of data. The end of file is
--      always preceded by an implicit logical line terminator and page terminator.
--
--      The procedure READ_CHAR generates a page_term character corresponding
--      to the implicit page terminator which precedes the end of file.
--      The implicit LINE_TERMINATOR which precedes each page terminator is
--      not generated READ_CHAR.
--
--      In the implementation of TEXT_IO, the code which interprets or
--      produces the physical file syntax has been isolated in the
--      following procedures:
--
--      read_char    - gets the next input character or terminator.
--      end_of_line  - checks if a line, page or file terminator is next.
--      end_of_page  - checks if a page or file terminator follows.
--      end_of_file  - checks if a file terminator follows.
--      txt_put_char - output a logical character.
--      txt_new_line - starts a new line.
--      txt_new_page - starts a new page.
--      write_char   - puts the next physical character.
--

-----  
-- FAST INTERRUPT ENTRIES --  
-----

--Prompt Interrupt Entry:

PROMPT

--This is a Fast Interrupt Entry, invoked by an interrupt other than  
--NMI or Single Step, whose accept body receives control after an  
--interrupt more quickly than an ordinary interrupt entry but more  
--slowly than a Quick or a Non-Maskable Interrupt Entry. The accept  
--body may make conditional entry calls to entries that have been  
--declared to be Trivial Entries by means of the pragma  
--TRIVIAL\_ENTRY.

--When this kind of interrupt entry occurs, the state of the 8087  
--Numeric Data Processor will always be saved as part of the context  
--of the interrupted task, because the normal task-switching  
--mechanism will attempt to restore it before resuming the  
--interrupted task.

--Note: In the following constant names, "NDP" stands for "Numeric Data  
--Processor," i.e., the Intel 8087.

--Quick Interrupt Entries:

SIMPLE\_QUICK

--This is a Quick Interrupt Entry, invoked by an interrupt other than  
--NMI or Single Step, whose accept body makes no entry calls.

NO\_NDP\_SIMPLE\_QUICK

--This is a Quick Interrupt Entry, invoked by an interrupt other than  
--NMI or Single Step, whose accept body makes no entry calls.

--It differs from SIMPLE\_QUICK only in that the state of the 8087  
--Numeric Data Processor is neither saved nor restored during  
--interrupt delivery.

SIGNALLING\_QUICK

--This is a Quick Interrupt Entry, invoked by an interrupt other than  
--NMI or Single Step, whose accept body may make conditional entry  
--calls to entries that have been declared to be Trivial Entries by  
--means of the pragma TRIVIAL\_ENTRY.

~~When this kind of interrupt entry occurs, the state of the 8087~~  
--Numeric Data Processor will always be saved as part of the context  
--of the interrupted task, because the normal task-switching  
--mechanism will attempt to restore it before resuming the  
--interrupted task.

--Non-Maskable Interrupt Entries:

NON\_MASKABLE

## APPENDIX C

### TEST PARAMETERS

Certain tests in the ACVC make use of implementation-dependent values, such as the maximum length of an input line and invalid file names. A test that makes use of such values is identified by the extension .TST in its file name. Actual values to be substituted are represented by names that begin with a dollar sign. A value must be substituted for each of these names before the test is run. The values used for this validation are given below.

| Name and Meaning   | Value  |
|--|--|
| <u>\$BIG_ID1</u><br>Identifier the size of the maximum input line length with varying last character.                                  | <1..119 => 'A', 120 => '1'>                  |
| <u>\$BIG_ID2</u><br>Identifier the size of the maximum input line length with varying last character.                                  | <1..119 => 'A', 120 => '2'>                  |
| <u>\$BIG_ID3</u><br>Identifier the size of the maximum input line length with varying middle character.                                | <1..59 => 'A', 60 => '3',<br>61..120 => 'A'> |
| <u>\$BIG_ID4</u><br>Identifier the size of the maximum input line length with varying middle character.                                | <1..59 => 'A', 60 => '4',<br>61..120 => 'A'> |
| <u>\$BIG_INT_LIT</u><br>An integer literal of value 298 with enough leading zeroes so that it is the size of the maximum line length.  | <1..117 => '0', 118..120 => '298'>           |
| <u>\$BIG_REAL_LIT</u><br>A universal real literal of value 690.0 with enough leading zeroes to be the size of the maximum line length. | <1..114 => '0', 115..120 => '69.0E1'>        |

|  |                           |
|--|---------------------------|
| \$BIG_STRING1  | <1..60 => 'A'>            |
| A string literal which when catenated with BIG_STRING2 yields the image of BIG_ID1.                                    |                           |
| \$BIG_STRING2  | <1..59 => 'A', 60 => 'A'> |
| A string literal which when catenated to the end of BIG_STRING1 yields the image of BIG_ID1.                           |                           |
| \$BLANKS   | <1..100 => ' ' >          |
| A sequence of blanks twenty characters less than the size of the maximum line length.                                  |                           |
| \$COUNT_LAST   | 2_147_483_647             |
| A universal integer literal whose value is TEXT_IO.COUNT'LAST.   |                           |
| \$FIELD_LAST   | 2_147_483_647             |
| A universal integer literal whose value is TEXT_IO.FIELD'LAST.   |                           |
| \$FILE_NAME_WITH_BAD_CHARS   | BAD-CHARS`#.%!X           |
| An external file name that either contains invalid characters or is too long.  |                           |
| \$FILE_NAME_WITH_WILD_CARD_CHAR  | WILD-CHAR*.NAM            |
| An external file name that either contains a wild card character or is too long.                                       |                           |
| \$GREATER_THAN_DURATION  | 75_000.0                  |
| A universal real literal that lies between DURATION'BASE'LAST and DURATION'LAST or any value in the range of DURATION. |                           |
| \$GREATER_THAN_DURATION_BASE_LAST  | 131_073.0                 |
| A universal real literal that is greater than DURATION'BASE'LAST.  |                           |
| \$ILLEGAL_EXTERNAL_FILE_NAME1  | BADCHAR`@.~!              |
| An external file name which contains invalid characters.   |                           |

|  |  |
|--|--|
| <u>\$ILLEGAL_EXTERNAL_FILE_NAME2</u><br>An external file name which<br>is too long.  | THIS-FILE-NAME-WOULD-BE-PERFECTLY<br>-LEGAL-IF-IT-WERE-NOT-SO-LONG--<br>IT-HAS-NEARLY-ONE-HUNDRED-SIXTY-<br>CHARACTERS |
| <u>\$INTEGER_FIRST</u><br>A universal integer literal<br>whose value is INTEGER'FIRST.   | -2_147_483_648   |
| <u>\$INTEGER_LAST</u><br>A universal integer literal<br>whose value is INTEGER'LAST.   | 2_147_483_647  |
| <u>\$INTEGER_LAST_PLUS_1</u><br>A universal integer literal<br>whose value is INTEGER'LAST + 1.  | 2_147_483_648  |
| <u>\$LESS_THAN_DURATION</u><br>A universal real literal that<br>lies between DURATION'BASE'FIRST<br>and DURATION'FIRST or any value<br>in the range of DURATION.           | -75_000.0  |
| <u>\$LESS_THAN_DURATION_BASE_FIRST</u><br>A universal real literal that is<br>less than DURATION'BASE'FIRST.   | -131_073.0   |
| <u>\$MAX_DIGITS</u><br>Maximum digits supported for<br>floating-point types.   | 15   |
| <u>\$MAX_IN_LEN</u><br>Maximum input line length<br>permitted by the implementation.   | 120  |
| <u>\$MAX_INT</u><br>A universal integer literal<br>whose value is SYSTEM.MAX_INT.  | 2_147_483_647  |
| <u>\$MAX_INT_PLUS_1</u><br>A universal integer literal<br>whose value is SYSTEM.MAX_INT+1.   | 2_147_483_648  |
| <u>\$MAX_LEN_INT_BASED_LITERAL</u><br>A universal integer based<br>literal whose value is 2#11#<br>with enough leading zeroes in<br>the mantissa to be MAX_IN_LEN<br>long. | <1..2 => '2:', 3..117 =><br>'0', 118..120 => '11:'>  |

\$MAX\_LEN\_REAL\_BASED\_LITERAL

A universal real based literal whose value is 16:F.E: with enough leading zeroes in the mantissa to be MAX\_IN\_LEN long.

<1..3 => '16:', 4..116 => '0', 117..120 => 'F.E:'>

\$MAX\_STRING\_LITERAL

A string literal of size MAX\_IN\_LEN, including the quote characters.

<1 => '"', 2..119 => 'A', 120 => '">

\$MIN\_INT

A universal integer literal whose value is SYSTEM.MIN\_INT.

-2\_147\_483\_648

\$NAME

A name of a predefined numeric type other than FLOAT, INTEGER, SHORT\_FLOAT, SHORT\_INTEGER, LONG\_FLOAT, or LONG\_INTEGER.

No\_Such\_Type

\$NEG\_BASED\_INT

A based integer literal whose highest order nonzero bit falls in the sign bit position of the representation for SYSTEM.MAX\_INT.

16#FFFFFFFFE#

## APPENDIX D

### WITHDRAWN TESTS

Some tests are withdrawn from the ACVC because they do not conform to the Ada Standard. The following 28 tests had been withdrawn at the time of validation testing for the reasons indicated. A reference of the form "AI-ddddd" is to an Ada Commentary.

- B28003A: A basic declaration (line 36) wrongly follows a later declaration.
- E28005C: This test requires that 'PRAGMA LIST (ON);' not appear in a listing that has been suspended by a previous "pragma LIST (OFF);"; the Ada Standard is not clear on this point, and the matter will be reviewed by the ARG.
- C34004A: The expression in line 168 wrongly yields a value outside of the range of the target type T, raising CONSTRAINT\_ERROR.
- C35502P: Equality operators in lines 62 & 69 should be inequality operators.
- A35902C: Line 17's assignment of the nominal upper bound of a fixed-point type to an object of that type raises CONSTRAINT\_ERROR, for that value lies outside of the actual range of the type.
- C35904A: The elaboration of the fixed-point subtype on line 28 wrongly raises CONSTRAINT\_ERROR, because its upper bound exceeds that of the type.
- C35904B: The subtype declaration that is expected to raise CONSTRAINT\_ERROR when its compatibility is checked against that of various types passed as actual generic parameters, may in fact raise NUMERIC\_ERROR or CONSTRAINT\_ERROR for reasons not anticipated by the test.
- C35A03E, These tests assume that attribute 'MANTISSA returns 0 when  
& R: applied to a fixed-point type with a null range, but the Ada Standard doesn't support this assumption.
- C37213H: The subtype declaration of SCONS in line 100 is wrongly expected to raise an exception when elaborated.
- C37213J: The aggregate in line 451 wrongly raises CONSTRAINT\_ERROR.

C37215C, Various discriminant constraints are wrongly expected  
E, G, H: to be incompatible with type CONS.

C38102C: The fixed-point conversion on line 23 wrongly raises  
CONSTRAINT\_ERROR.

C41402A: 'STORAGE\_SIZE is wrongly applied to an object of an access  
type.

C45332A: The test expects that either an expression in line 52 will  
raise an exception or else MACHINE\_OVERFLOW is FALSE.  
However, an implementation may evaluate the expression  
correctly using a type with a wider range than the base type of  
the operands, and MACHINE\_OVERFLOW may still be TRUE.

C45614C: REPORT.IDENT\_INT has an argument of the wrong type  
(LONG\_INTEGER).

E66001D: Wrongly allows either the acceptance or rejection of a  
parameterless function with the same identifier as an  
enumeration literal; the function must be rejected (see  
Commentary AI-00330).

A74106C, A bound specified in a fixed-point subtype declaration  
C85018B, lies outside of that calculated for the base type, raising  
C87B04B, CONSTRAINT\_ERROR. Errors of this sort occur re lines 37 & 59,  
CC1311B: 142 & 143, 16 & 48, and 252 & 253 of the four tests,  
respectively (and possibly elsewhere).

BC3105A: Lines 159..168 are wrongly expected to be illegal; they are  
legal.

AD1A01A: The declaration of subtype INT3 raises CONSTRAINT\_ERROR for  
implementations that select INT'SIZE to be 16 or greater.

CE2401H: The record aggregates in lines 105 & 117 contain the wrong  
values.

CE3208A: This test expects that an attempt to open the default output  
file (after it was closed) with mode IN\_FILE raises NAME\_ERROR  
or USE\_ERROR; by Commentary AI-00048, MODE\_ERROR should be  
raised.
